

DAVID STOYKA — AI SOLUTIONS & AUTOMATION

Turning Real Business Problems Into Working AI-Powered Solutions

I combine decades of business, sales, digital publishing, and technology experience with hands-on AI-assisted development to solve real operational problems. At CarCollectorsClub.com, I designed and built connected applications, automation workflows, data pipelines, API integrations, AI research systems, and publishing tools that are used in day-to-day operations.

The projects below show how I turn business problems into working systems — designing the solution, connecting the right tools, using AI where it adds value, and putting the result into production.

AI • AUTOMATION • APIS • WEBHOOKS • DATA SYNCHRONIZATION •
WORKFLOW ORCHESTRATION • BUSINESS PROCESS DESIGN

THE BUSINESS CHALLENGE

CarCollectorsClub.com Had Outgrown Its Manual Publishing Operations

Managing hundreds of collector-car events, auctions, venues, organizers, articles, dates, images, and social posts required information to move across several systems. Researching new dates, validating records, updating WordPress, maintaining Google Sheets, publishing content, and keeping event data synchronized created repetitive work and opportunities for errors as the operation continued to grow.

The challenge was not simply creating content. It was keeping research, data, publishing, and multiple connected systems accurate, synchronized, and scalable.

THE SOLUTION

Replace Disconnected Manual Work With One Connected Operating System

Instead of continuing to solve each task manually, I designed a connected operating system around the publishing process. A custom dashboard became the control center. Behind it, Node.js services, n8n workflows, AI agents, custom scrapers, Google Sheets, webhooks, REST APIs, WordPress, The Events Calendar, and MySQL-backed site data work together to research, validate, enrich, publish, update, and synchronize event information.

[Skip to content](#)

The result is a practical production system that reduces repetitive work, improves data consistency, speeds publishing, and gives the business a more scalable way to manage its event and auction operations.

01 • CCC PUBLISHER DASHBOARD

A Custom Dashboard That Cuts 30+ Hours of Manual Work to Less Than One Hour

CarCollectorsClub.com manages hundreds of collector-car events, auctions, venues, organizers, articles, dates, images, and publishing tasks. I designed the CCC Publisher Dashboard to bring those operations into one visual control center instead of managing them across disconnected tools and manual processes.

The dashboard gives the operator a live view of event data, publishing status, venue and organizer information, WordPress IDs, dates, social-post status, and workflow results. From the same interface, the user can launch AI-assisted and automated workflows that research, validate, update, publish, synchronize, and distribute event information.

01

Easy One-Click Workflow Automation

Each dashboard button launches a specific automated workflow, allowing the operator to research dates, update and publish content, validate venues and organizers, synchronize WordPress data, distribute social content, refresh records, or run auction discovery — all from one simple interface.

A screenshot of a web form titled "Add New Event" with a close button (X) in the top right corner. The form contains several input fields and sections. At the top is the "Event Name" field with a red asterisk and a placeholder text: "Enter the most specific event name available. Better: 'Mecum Auction Houston'; less helpful: 'Mecum Auction'." Below this is the "Official Event Website" field with a red asterisk and a placeholder text: "Enter the main/root website for the event company or organizer." followed by the example URL "https://www.mecum.com". The next row contains three fields: "Category" with a dropdown menu showing "Car Show", "Official Start Date" with a red asterisk and a date input field showing "mm/dd/yyyy", and "Official End Date" with a red asterisk and a date input field showing "mm/dd/yyyy". Below these is a section titled "Optional Venue Discovery Details" with a sub-header "Optional location details help the AI agent identify the correct event, especially when an organizer runs events in multiple cities or countries." This section contains four input fields: "Venue Name" (with "Nashville Superspeedway" entered), "Venue City" (with "Houston" entered), "Venue State" (with "Texas" entered), and "Venue Country" (with "United States" entered). At the bottom right of the form are two buttons: "Cancel" and "Create Event".

Structured inputs for a new event workflow

02

Add a New Event in One Simple Step

The Add Event form captures the key information needed to start the process. From there, AI-assisted workflows can research the event, match venues and organizers, enrich the data, create the required records, and move the event into the publishing workflow.

[Skip to content](#)

Dashboard Statistics at a Glance

02 • BEHIND THE DASHBOARD

From One Button Click to a Fully Synchronized Content Update

[Skip to content](#) s only the control surface. Behind each action is a connected network that moves data across the systems required to complete the job.

When the operator selects an existing car show and clicks Update Content & Publish, the dashboard sends the request into the backend automation layer. The workflow retrieves the current event and article data, uses AI where needed to improve and format the content, prepares the updated publishing payload, synchronizes the changes with WordPress and Google Sheets, and returns the result to the dashboard.

The entire process is designed to keep the event record, article content, WordPress data, IDs, metadata, images, and operating data synchronized without requiring the user to manually move between systems.

HOW THE SYSTEMS WORK TOGETHER

A Connected Production Workflow

The workflow combines application logic, webhook-driven automation, AI-assisted content processing, REST/API requests, WordPress publishing, and source-of-truth data synchronization. Existing records are retrieved before updates are made, allowing the system to work with the current article, event, venue, organizer, metadata, and image information rather than rebuilding the record from scratch.

This approach keeps the user experience simple while allowing a much more sophisticated process to run behind the interface.

API-Driven Integration

Uses HTTP GET, POST, and PUT requests to move and update information across connected systems.

AI-Assisted Content Processing

Uses AI to rewrite, format, and improve event content where needed.

Synchronized Data

Keeps Google Sheets and WordPress publishing data aligned as the workflow completes.

Closed-Loop Feedback

Returns workflow results back through the backend so the dashboard can show completion and refresh current data.

[Skip to content](#)

03 • WORKFLOW ORCHESTRATION

A Connected Automation System Built from Specialized Workflows

The CCC automation environment is made up of specialized workflows that handle different parts of the publishing and data lifecycle. Each workflow performs a specific job — research, validation, content creation, synchronization, publishing, or distribution — while sharing the same connected operating model. Structured inputs, automated decision logic, AI-assisted processing, API communication, and data synchronization allow each workflow to do far more than a single manual task.

Together, these workflows turn what were once separate manual tasks into a connected operating system.

Complete CCC automation environment showing the connected workflow architecture used for research, validation, publishing, synchronization, and distribution.

01 Master Database Sync (WP → Google Sheets)

Pull WordPress post and event records through API calls, normalize key fields, and write synchronized data back into Google Sheets so the operating sheet remains the current source of truth.

02 AI-Assisted Event Date Discovery, Research & Date Scout

Research upcoming event dates, verify source information with AI-assisted review, normalize the confirmed results into structured data, and synchronize the updated event information back into Google Sheets.

03 AI-Assisted Venue & Organizer Validation, Creation & Synchronization

Retrieve event data, verify venue and organizer records, use AI-assisted matching to identify the correct entities, create missing records when needed, prevent duplicates, and synchronize validated IDs and data across Google Sheets, WordPress, and The Events Calendar.

04 AI-Assisted Existing Car Show Content Update

Retrieve existing WordPress event and article data, use AI-assisted research and formatting to improve the content, prepare the required update payloads, update event, image, SEO, and publishing data through APIs, and synchronize the results back into the operating sheet.

05 AI-Assisted New WordPress Content Creation

Create new car show or auction content when no existing article record is present, using AI-assisted research, content generation, formatting, structured payload creation, WordPress and event publishing, image generation, and returned ID synchronization.

[Skip to content](#)

06 AI-Assisted Social Media Distribution

Transform approved event content into platform-specific social posts, generate supporting messaging and hashtags, publish through connected social APIs, and record distribution results back into Google Sheets.

FEATURED WORKFLOW 01

AI-Assisted Date Discovery & Research

Researches event dates and source information, uses AI-assisted discovery and validation, and writes structured results back into the operating data system.

[Skip to content](#)

FEATURED WORKFLOW 02

Venue & Organizer Validation / Matching

Searches existing records, evaluates venue and organizer information, resolves matches, prevents unnecessary duplicates, and synchronizes IDs and updates across connected systems.

FEATURED WORKFLOW 03

AI-Assisted Social Media Distribution

Adapts approved event content for multiple social platforms, prepares platform-specific data and hashtags, publishes through API-driven workflows, and logs distribution results.

04 • AUTOMATED DISCOVERY

Automated Auction Discovery Built for Repeatable, Structured Intelligence

THE PROBLEM

Collector-car auction schedules are spread across many websites with different layouts, date formats, naming conventions, and venue details. Manually reviewing those sites and preparing the information for publishing created a repetitive research process that was difficult to scale.

THE SOLUTION

I designed a custom auction discovery system that runs site-specific scraper scripts, extracts upcoming auction data, normalizes the results into a consistent structure, and sends newly discovered records into the CCC data and publishing pipeline for validation, enrichment, synchronization, and publishing.

The goal was not simply to scrape webpages — it was to turn changing public auction information into structured, reusable business data.

[Skip to content](#)

End-to-end auction discovery architecture showing how a dashboard action triggers scraper execution, structured extraction, data staging, AI-assisted enrichment, WordPress/TEC publishing, synchronization, and response handling.

Skip to content running in VS Code — the Node.js runner visits the live auction schedule, extracts upcoming events, structured fields, and checks the staging data before completing the run.

WORKING PROOF

From Live Auction Websites to Structured Event Data

Each site-specific runner visits the target auction website, identifies upcoming auction records, extracts the relevant event details, and converts them into a consistent data structure.

The Mecum example shown here returns structured fields such as auction name, city, date range, organizer ID, normalized end date, source URL, and record key before checking whether the staging data is already current.

The structured output is then available to the connected Google Sheets and n8n workflow layer for downstream validation, enrichment, publishing, and synchronization.

05 • CONNECTED DATA & SYNCHRONIZATION

From Hundreds of Manual Data Entries to One Simple Dashboard

CarCollectorsClub.com relies on a structured Google Sheets database as the central operating source of truth for event, auction, venue, organizer, publishing, and workflow data.

That database connects the front-end dashboard with the automation, research, publishing, and synchronization processes running behind it.

[Skip to content](#)

Past: Manual Research and Data Maintenance

Event dates, venue details, organizer information, URLs, WordPress IDs, duplicate records, and publishing data had to be researched, checked, entered, and maintained manually across multiple systems.

Keeping the database current meant repeatedly searching websites, verifying upcoming dates, looking up venue addresses, reviewing records for errors or duplicates, and manually entering corrections.

NOW

Now: One Dashboard Bringing the Entire Workflow Together

The Dashboard, Google Sheets source of truth, n8n workflows, AI-assisted research, APIs, WordPress, The Events Calendar, and synchronization processes now work together as one connected operating system.

Information can be discovered, validated, enriched, updated, published, and written back into the operating data without manually moving between every system.

BUSINESS IMPACT

30+ Hours of Manual Work Saved Each Week

The connected workflow dramatically reduced repetitive research and data entry while improving consistency across event records, venue and organizer data, publishing IDs, dates, and downstream updates.

The result is faster publishing, fewer avoidable errors, better duplicate control, more reliable event data, and substantially less time spent maintaining records by hand.

Estimated operational time savings based on prior weekly manual research, verification, and data-entry workload.

[Skip to content](#)

From Manual Data Management to One Synchronized Data Hub

What once required hours of manual research, checking, and data entry is now handled through the Dashboard and automated workflows. Dates are researched, venues and organizers are validated, duplicates are identified, records are updated, and the results are synchronized across Google Sheets, WordPress, and The Events Calendar. What once required hours of manual research, checking, and data entry can now be handled with the click of a button.

CCC structured event database — the operational source of truth used to maintain event, auction, venue, organizer, publishing, and workflow data across the connected system.

How the Data Moves Through the System

The Dashboard and automated workflows use the same structured data to research, validate, update, publish, and synchronize information across the connected systems.

Dashboard

Google Sheets

Skip to content + n8n Workflows

REST APIs & Webhooks

WordPress + The Events Calendar**Synchronized Results Back to Google Sheets**

DATA & OPERATING RECORDS

Google Sheets · Google Sheets API · MySQL-Backed WordPress Data

Stores and exchanges the structured event, venue, organizer, publishing, and workflow data used by the connected system.

INTEGRATION & COMMUNICATION

REST APIs · Webhooks · HTTP GET / POST / PUT

Moves information between the Dashboard, automation workflows, Google Sheets, WordPress, The Events Calendar, and other connected services.

VALIDATION & SYNCHRONIZATION

Record Matching · WordPress / TEC Updates · Data Synchronization

Validates records, prevents mismatches and duplicates, updates the correct systems, and writes returned IDs, status, and publishing data back into the operating dataset.

CLOSED-LOOP DATA

Synchronization Matters as Much as Automation

The value of the system is not simply that individual tasks are automated. The workflows also keep information aligned across the systems that depend on it.

[Skip to content](#)

Event records, venue and organizer IDs, publishing data, status information, and returned API results can be written back into the source-of-truth dataset so the next workflow starts with the most current information available.

This closed-loop synchronization reduces repeated data entry and helps prevent the different systems from drifting apart over time.

07 • BUSINESS IMPACT

From Manual Work to a Connected Publishing System

What started as a need to reduce repetitive research and data entry became a connected operating system for CarCollectorsClub.com.

The Dashboard now brings together AI-assisted research, custom scrapers, n8n workflows, Google Sheets, APIs, WordPress, The Events Calendar, and synchronized data into one working process.

BUSINESS IMPACT

From Manual Work to a Connected Publishing System

Business impact summary — the CCC operating model evolved from repetitive manual research and data entry into a connected workflow built around one dashboard, synchronized data, automation, publishing, and human oversight.

30+ Hours

Saved Each Week

Manual research, verification, data entry, duplicate checking, and record maintenance were reduced dramatically through automation and dashboard-controlled workflows.

Faster

Publishing

Events and auctions can move from discovery and validation to publishing much faster, without repeatedly moving information between disconnected tools.

[Skip to content](#) | Estimated time savings based on prior manual research, verification, and data-entry

workload.

More Reliable

Data

Record matching, validation, structured updates, and synchronization help keep dates, venues, organizers, IDs, and publishing data more accurate and consistent.

More Capacity

Without More Manual Work

The system allows CarCollectorsClub.com to maintain and publish more event and auction information without increasing manual effort at the same rate.

MORE THAN ONE AUTOMATION

The real value did not come from one AI tool, one scraper, or one workflow. It came from connecting the pieces into a practical system that supports the entire process — from research and data validation through publishing, synchronization, and human review.

The result: less repetitive work, better data, faster publishing, and more time available for higher-value business activities.

06 • APPLICATION DEVELOPMENT

CarPics AI

PLACEHOLDER SECTION

A dedicated case study for the CarPics AI application will be added here, covering the business need, product experience, AI capabilities, and implementation.

CASE STUDY IN DEVELOPMENT

PROFESSIONAL APPROACH

Practical AI, grounded in the way the business actually works.

PLACEHOLDER COPY

I work from business process to production system—clarifying the operational need, selecting the right tools, connecting the data, and building for maintainability and trust.
